Who am I

- Been with Oracle since 1993
- User of Oracle since 1987
- The "Tom" behind AskTom in Oracle Magazine
  - *www.oracle.com/oramag*
- Expert Oracle Database Architecture
- Effective Oracle by Design
- Expert One on One Oracle
- Beginning Oracle

New Ideas – Almost always come from those uncommitted to the status quo – from outsiders

People are committed to whatever has worked for them in the past.

Best Practices defined –

Consensus of expert opinions, based on actual customer experiences in practice.

Lessons learned.

Proven practices associated with a particular usage profile.

Baseline configuration rules - prerequisite to tuning.

Sounds all good…

Best Practices – It is easy with Best Practices to forget that once a practice has been branded as "Best", that it may **represent certain tradeoffs** and may **involve noteworthy downside potential**. It is also easy to forget the *context* for which any given practice was promoted as "Best", and therefore **apply it in some inappropriate context.**

- Bob Sneed, Sun Microsystems

ORACLE®

Bryn Llewellyn on Best Practices

Prescribing best practice principles for programming any 3GL is phenomenally difficult. One of the hardest challenges is the safety of the assumption that the reader starts out with these qualities

- [overlapping illegible text] … along the way?)

"What is the best way..?" – Questions that begin and end with that can drive you nuts.

If there was a universal best way to do something, we would not have implemented the other ways…

AskTom "What is The best way?"

ORACLE®

**Is there
a *best* way
to do something – every
time?**

```
select *
  from t1, t2
 where t1. id = t2. id
    and t1.small_distinct = :x
```

- T1 is large, where small_distinct = :x returns much of the table

- T2 is large

Is there a *best* way to do something – every time?

```
select * from t1, t2
 where t1. id = t2. Id and t1.small_distinct = :x
```

```
HASH JOIN                          SELECT STATEMENT

    TABLE ACCESS FULL T1             NESTED LOOPS

    TABLE ACCESS FULL T2

                                       TABLE ACCESS BY INDEX ROWID(T1)

                                         INDEX RANGE SCAN T1_IDX

                                       TABLE ACCESS BY INDEX ROWID(T2)
```

ORACLE

```
                                         INDEX UNIQUE SCAN T2_PK
```

Is there a *best* way to do something – every time?

```
HASH JOIN                              SELECT STATEMENT
   TABLE ACCESS FULL T1                 NESTED LOOPS
   TABLE ACCESS FULL T2                    TABLE ACCESS BY INDEX ROWID(T1)

                                             INDEX RANGE SCAN T1_IDX
                                          TABLE ACCESS BY INDEX ROWID(T2)

                                             INDEX UNIQUE SCAN T2_PK
```

call	count	cpu	elapsed	disk	query
Fetch	35227	5.63	9.32	23380	59350
Fetch	35227	912.07	3440.70	1154555	121367981

Is there
a *best* way
to do something – every
time?

```
HASH JOIN                              SELECT STATEMENT
   TABLE ACCESS FULL T1                 NESTED LOOPS
   TABLE ACCESS FULL T2                   TABLE ACCESS BY INDEX ROWID(T1)

                                           INDEX RANGE SCAN T1_IDX
                                         TABLE ACCESS BY INDEX ROWID(T2)

                                           INDEX UNIQUE SCAN T2_PK
```

call	count	cpu	elapsed	disk	query
Fetch	1	4.55	5.16	12152	12456
Fetch	1	0.05	0.09	12	15

ORACLE®

It takes a context – *It is also easy to forget the* *context* *for which any given practice was promoted as "Best", and therefore apply it in* *some inappropriate context*

Indexes are 'best', everyone knows that…

It takes understanding too –
You need to take the facts, coupled with your knowledge,

How do I tune with tkprof…

What can you do with this information?

```
select count(subobject_name) from big_table.big_table

COUNT(SUBOBJECT_NAME)
--------------------

call      count        cpu      elapsed        disk       query
total         4      99.36       262.11     1840758     1840800

Rows        Row Source Operation
      1     SORT AGGREGATE (cr=1840797 pr=1840758 pw=0 time=262104893 us)
128000000     TABLE ACCESS FULL BIG_TABLE (cr=1840797 pr=1840758 pw=0 time=384004887 us)
```

Event waited on	Times	Max. Wait	Total Waited
db file scattered read	14425	0.22	195.87

ORACLE

- Query took a long time – *if we make it fast…*
- We did a ton of physical IO – *and that is slow*
- We did a ton of logical IO – *and that is not 'free'*
- There is a big difference between elapsed and cpu – *we were waiting for something*
- We can see our query and plan – *we know the answer to the query*

- We know the data (it is ours after all)
- How Oracle works (hopefully!)

- We needed a very small subset of the rows – 700k out of 128m

- The table looks well packed – simple math, divide IO's (cr=1,840,797) by rows (128,000,000), about 70 rows/block and given we know the average row width (it is our data after all…) that sounds nicely packed

  - What can we rule out now? Shrink and Rebuild…

ORACLE

- Make full scan faster
  - Maybe by compressing the table
  - Maybe by including subobject_name in some index (to avoid the table)
- Remove Full Scan
  - We are interested in only 0.6% of the data
  - Maybe a new index would help
- Don't do it or do it differently…

ORACLE®

- It will be more complex in general

- But the process is the same

  - Get *facts*

  - *Infer* more facts

  - Build your *context*!

  - Rule things *out*

    - Ruling something out is as good as ruling something in

    - Many best practices will fall by the wayside here

Educated Incapacity – A barrier to creative ideas can be experience, 'the best way'

"This 'telephone' has too many shortcomings to be seriously considered as a means of communication. The device is inherently of no value to us." **– Western Union internal memo, 1876.**

" The concept is interesting and well-formed, but in order to earn better than a 'C,' the idea must be feasible." **– Yale University management professor in response to Fred Smith's paper proposing reliable overnight delivery service. Smith went on to found Federal Express Corp.**

Although experience is often valuable, it can be a liability in a search for creative ideas.
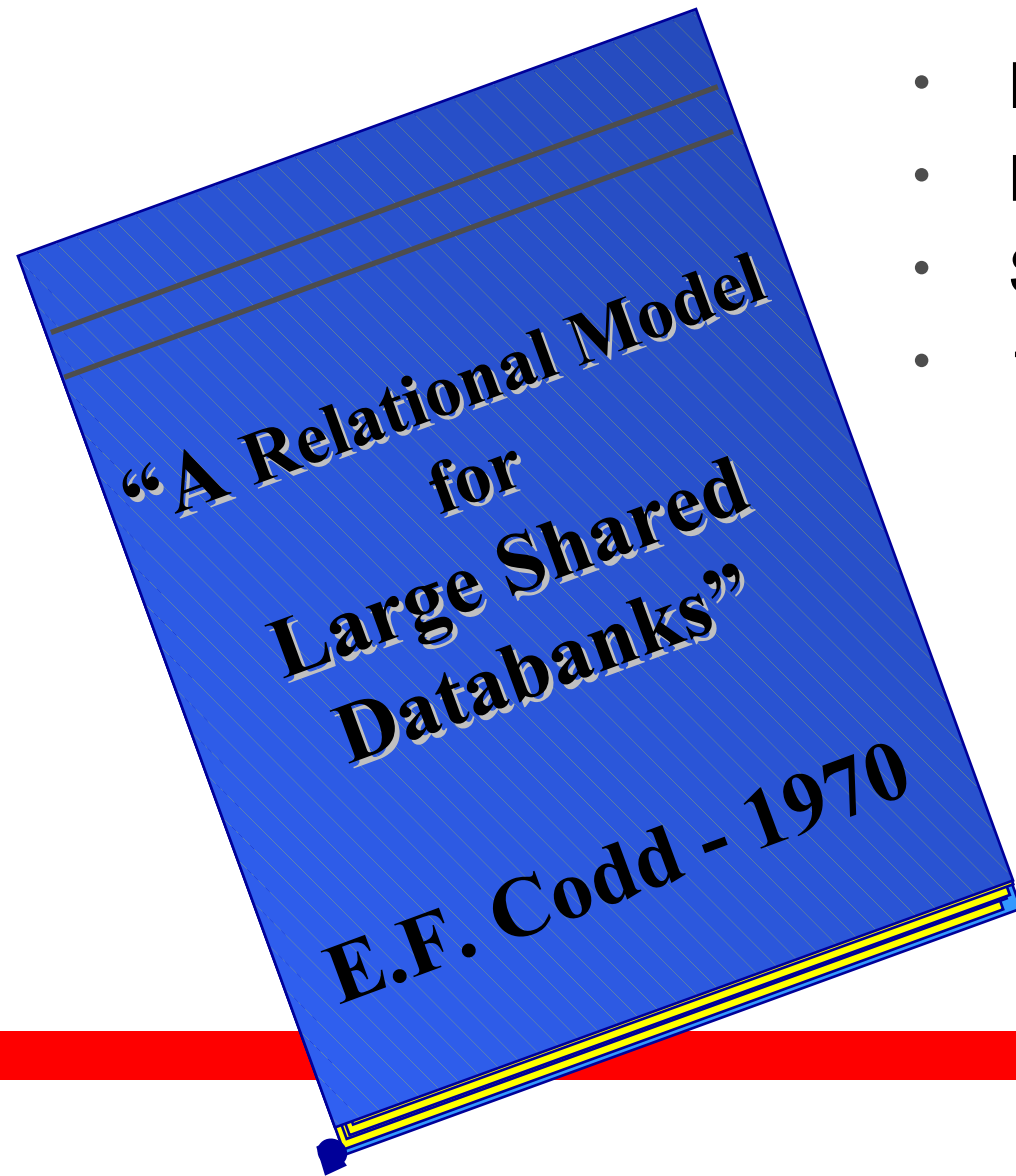

So, What is the point?

The Beginning...

**When you were 12,
did you know what
you wanted to be
when you grew up?**

The Beginning...

"A Relational Model for Large Shared Databanks"

E.F. Codd – 1970

- Data Model with Structure
- Data Independent of Code
- Set-oriented
- 1977 the work begins

Continuous Rethinking

Continuous Change

Learn a new language – **else everything will look like a nail.**

C, C++, PL/l, Rexx, Exec, JCL, SAS, Pascal, Cobol, Java, Ada, PL/SQL, T-SQL, Prolog, Lisp, Scheme, Various Assemblers, many SQL dialects, many scripting languages, …
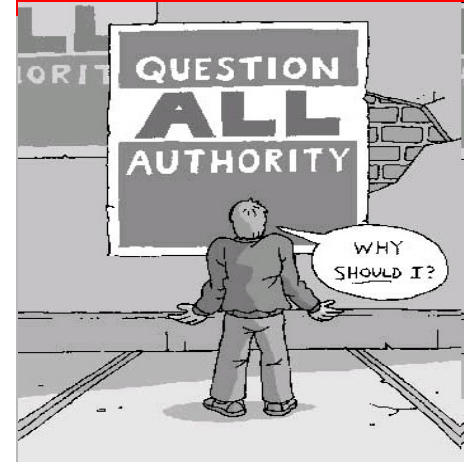

Don't tune a query – tune a process, an algorithm, the entire approach.

Don't fall into the sunk cost theory…

Always Question Everything – in a non-annoying way of course!

Question Authority…

Never stop testing ideas – Things change, I still remember how it worked in version 5.

The tuning techniques (best practices) of yesterday are today's performance / maintenance headaches…

Don't rule anything out until you try it – How do you *know* it won't work unless you try it. Just because it didn't work in a different *context* doesn't mean it won't work now.

You can't use any feature until it is 3 releases old – this is software, not fine wine…

ORACLE®

The simple solution is usually right – There are many ways to build an application. Not all of them need 14 tiers. Many applications are quite simple – there is room for many tools.

We get caught up in the novelty of the idea that we ignore how practical it really is…

Collaborate – Participate, Network, Exchange ideas.

I learn something new every day about Oracle – from the questions I get about Oracle…

ORACLE®

The Best Way…
